FIRE BUILDING AND CAMPCOOKERY

EXODUS 24:17

To the Israelites the glory of the LORD looked like a consuming fire on top of the mountain.

Introduction:

Fire is very important to all human race. It provides advantages such as;

Warmth

Protection

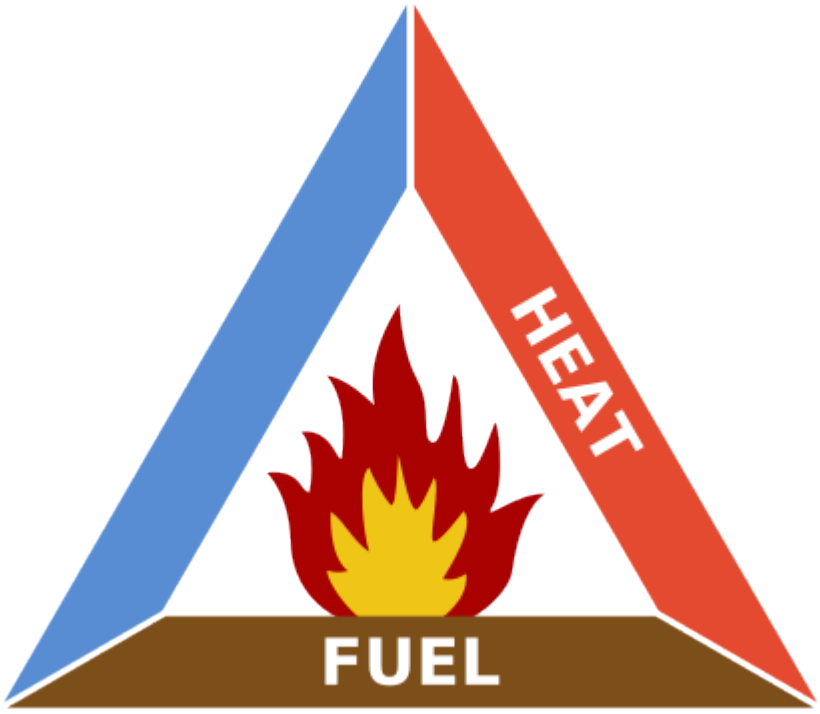

Food Preparation

What is fire ?

Chemically fire is a process in which a fuel and an oxidizing agent react, yielding carbon dioxide and water.

This process is known as combustion reaction

Fuels + oxygen + heat = fire

FIRE BUILDING

TYPES OF CAMPFIRE

g Cabin Fire

Tepee Fire

Star Fire

Pyramid Fi

Long Fire

Dakota Hole Fire

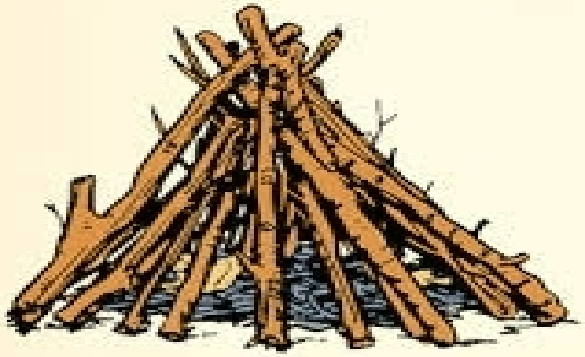

T Fire

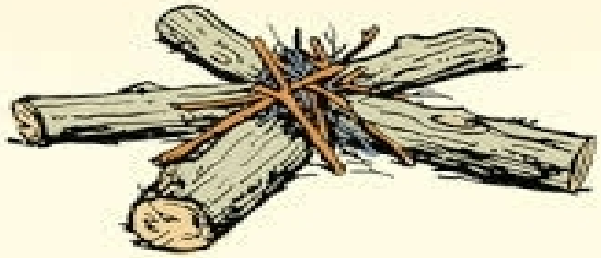

Keyhole Fi

6 CAMPFIRE LAYS EVERY MAN SHOULD KNOW

1. TEEPEE FIRE LAY

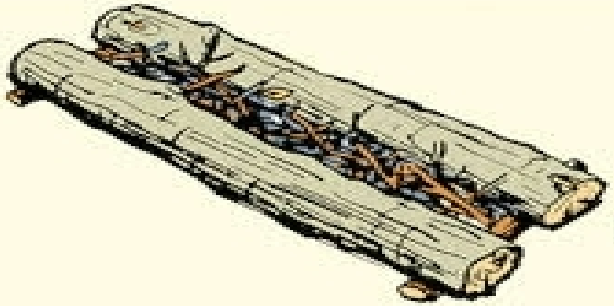

2. STAR FIRE LAY

3. LEAN-TO FIRE LAY

4. LOG CABIN FIRE LAY

5. LONG/PARALLEL FIRE LAY

6. THE PYRAMID/UPSIDE-DOWN/COUNCIL FIRE LAY

Fuzz sticks

A fuzz stick is a small piece of wood which has had slices cut in the sides to create small shavings. Ideally, the shavings should remain attached to the stick, but if they are accidentally removed, they can still be used. Because the shavings are thin, they are easy to ignite.

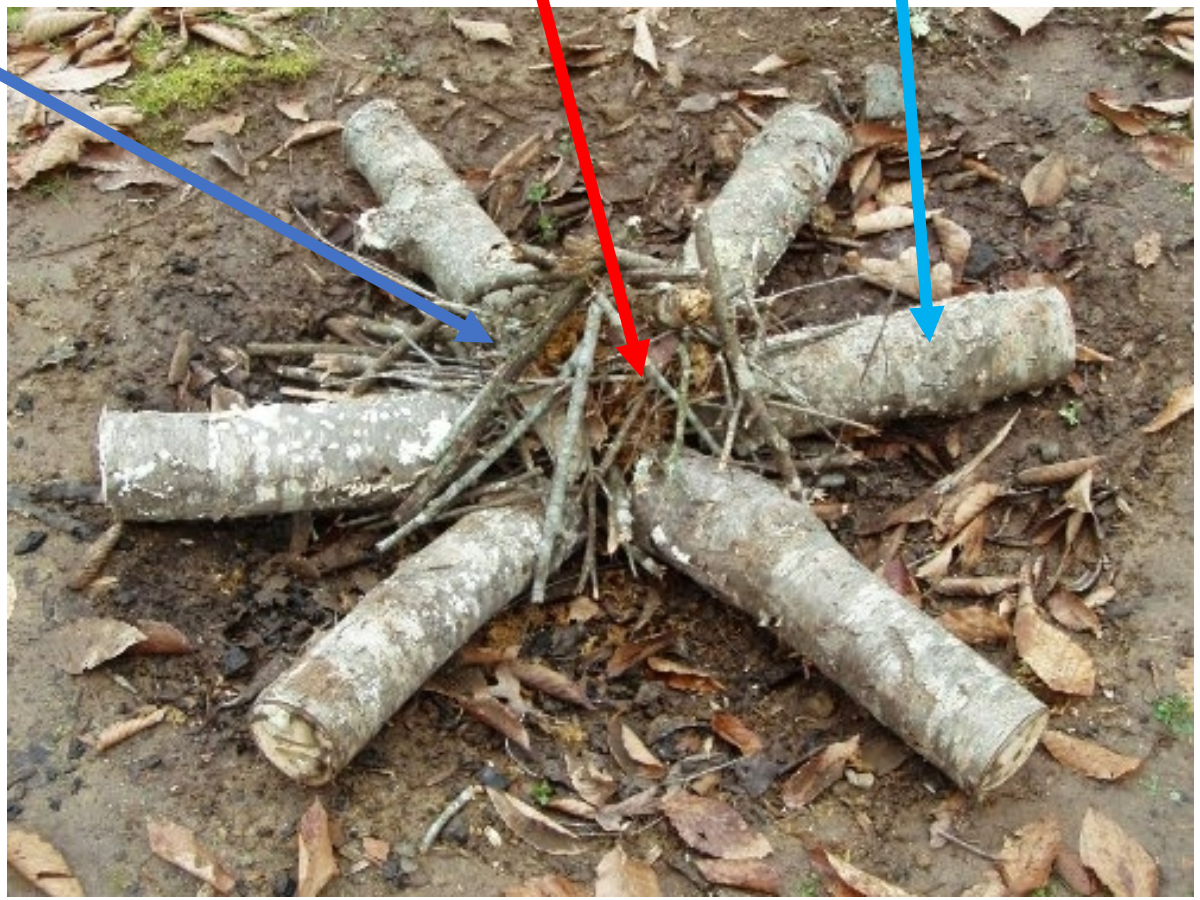

How To Make The Fuzz Sticks

TINDER, KIDLING & FUEL

Tinder consists of small, easily ignited material, such as pine needles, shreds of birch bark, thin twigs (whose diameter is about the same as a pencil lead), or even dryer lint.

Kindling is wood whose diameter ranges from pencil thickness to 4 cm

Fire Building Styles

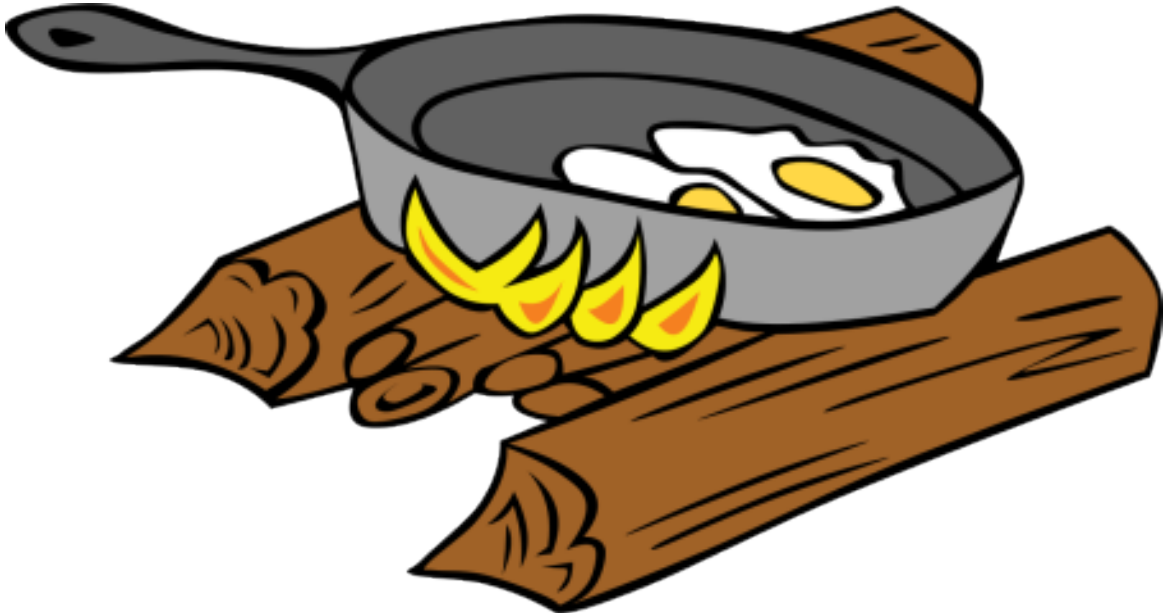

1. TRENCH FIRE

Dig a trench about 13 cm wide, sloping from ground level at the windward end to 13 cm wide and 17-22cm deep at the leeward (away-from-the- wind) end. Place five or six cross branches across trench to set pots and pans on for cooking. These cross branches should be wet or green

2. Hunter's Fire.

Use two green slow-burning logs for sides. Line them up so the wind blows between them. Logs should be 33-35cm apart at the wide end, close enough at narrow end for the smaller size cooking pan. (Rocks may be substituted for green logs.)

3.THE TEEPEE (WIGWAM) FIRE

The teepee fire is probably the most recognized campfire. It is somewhat difficult to lay however, as getting the logs to balance against one another can be tricky.

Sometimes the log pile will topple and upset the kindling and tinder beneath, and you'll have to start again from scratch. If necessary, you can lash them together at the top with twine (but don't use a synthetic rope such as nylon or polypropylene). Once laid, the teepee fire is very easy to light, as convection will take the flames right to the fuel.

4. Indian Fire.

Start with a tepee. Add hardwood sticks in a criss-cross fashion around the tepee. This fire is simple and quick. It gives good ventilation and long-lasting coals

5. Log Cabin Fire

Best kind of fire for a large group to sit around. Build this solidly, not as a log cabin with a hollow room. Place tinder and kindling high. Light this fire near its top. This fire can be built large or small, depending on the size of your group

6. Council fire

Like the log cabin fire, the council fire is very stable, and it falls into itself as it burns, remaining within the fire ring

This fire is hot, and will make a nice bed of coals for cooking. It also uses a lot of fuel.

This fire is sometimes called a **PYRAMID FIRE** as well.

The council fire was used by Native Ugandans and Americans during their meetings (or councils). It is very much like the log cabin fire except that more than two logs are laid on each layer. Be careful not to lay the logs too close to one another. Leave gaps of at least one inch (2.5 cm) between each log to allow air to circulate.

Like the log cabin fire, the council fire is very stable, and it falls into itself as it burns, remaining within the fire ring. Unlike the log cabin fire, the council fire lights easily as the main fuel is located directly above the kindling and tinder where convection will carry the flames. This fire is hot, and will make a nice bed of coals for cooking. It also uses a lot of fuel. This fire is sometimes called a pyramid fire as well.

7. Log Reflector Fire.

Use green logs for the reflector. Plug mud in the cracks. Build fire on windward side of reflector so smoke will blow away from you. For cooking, rake out a bed of coals to cook over.

LOG REFLECTOR FIRE

- This fire can be used for baking. The fire itself can be of any other form, and is placed in front of the reflector. This fire is also good for getting oneself warm. If you sit (or sleep) between the reflector and the fire, the side of you facing the fire will be warmed directly, while the reflector throws heat to the opposite side. Very toasty.
- You will be making the reflector from logs, which means the vertical members should be driven deeply into the ground to support the weight of the horizontal members. You can also use rocks to support them.

8. Rock Reflector Fire.

Good heating fire. The rocks keep radiating heat as the fire dies. For best reflection, place rocks on three sides of fire. Or use a natural cliff face or bank.

9. Backlog Fire.

- Cozy council fire for a few campers
- also good for heating.
- Use a big log or rock for the backlog. Lean several tepee fires against the backlog

10. Star Fire

11. Brush Fire.

Cut brush into convenient lengths and pile pieces parallel. A parallel fire burns hotter and faster. Start with small tepee fire on windward side. Don’t make the pile too large, and don’t burn on a windy day

12. CRANE FIRE

The Crane fire is a type of fire build to support a hanging pot over a fire. You can make the crane in various ways. A long stick with a weight on the back propped over a log or rock will work fine. Feel free to use whatever is handy for propping up a crane. A large rock or two work as well as a log for this crane.

This crane on the left, allows for adjusting the heat of cooking by raising or lowering the cooking pot over the fire. By spiraling the piece of rope around the large stick, you can raise and lower the pot by twisting the stick to wind on more rope, or release more rope. The tripod could also be a forked branch driven into the ground

13. THE DOUBLE SUPPORT CRANE

on the left is supported on both sides of the fire.

It is a popular choice and provides a stable crane. As seen on the right hand forked branch, use a small pile of rocks to hold the vertical supports where the ground is too hard to drive in a branch.

Fire safety

Fire Safety

- Locate the fire in a safe place. It should be clear for 10 feet (3 meters) all around.
- Do not light a fire beneath overhanging branches.
- Do not use accelerants, such as lighter fluid, gasoline, kerosene, etc. Learn to light a fire without these.
- Put the fire out completely before leaving it.

Fire Safety

- Do not build a fire on top of flammable material such as grass or leaves.
- Keep fire extinguishing supplies handy and near the fire. A bucket of water or sand, or a fire extinguisher are recommended.
- Do not remove burning sticks from a fire.
- Watch for embers that escape the fire pit and extinguish them immediately.
- Wear proper footwear around a fire.
- Be aware that paper, cardboard, and leaves create floating embers that rise out of the fire pit and may land dozens of yards away

GOD BLESS YOU
